**Empathy Map Canvas:**

An Empathy Map Canvas is a design thinking tool used to understand the needs, behaviors, challenges, and expectations of end users. For a Heart Disease Analysis using Tableau project, the primary users are doctors, cardiologists, hospital administrators, and healthcare analysts. The empathy map helps identify what users think, feel, see, hear, say, and do while working with patient health data. Understanding these aspects enables the development of an interactive Tableau dashboard that provides meaningful insights, improves decision-making, and enhances patient care.

| Section       | Description for Heart Disease Analysis                                                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Says</b>   | "I need accurate patient data to make better treatment decisions." "I want reports that are easy to understand."          |
| <b>Thinks</b> | How can I identify high-risk patients quickly? Which factors contribute most to heart disease?                            |
| <b>Does</b>   | Reviews patient records, analyzes medical reports, monitors vital signs, and uses Tableau dashboards to visualize trends. |

- Feels** Concerned about patient health, stressed by large volumes of data, and motivated to improve diagnosis and treatment outcomes.
- Sees** Large datasets, patient histories, medical test results, interactive charts, dashboards, and hospital reports.
- Hears** Feedback from patients, recommendations from specialists, hospital policies, and updates on healthcare guidelines.
- Pains** Manual data analysis is slow, identifying patterns is difficult, and hidden risk factors may be overlooked.
